

ENISS Statement

The importance of Nuclear Safety to support nuclear energy as a solution to the energy crisis and climate change

As a representative body of the European Nuclear Industry, ENISS recognises the [statement of WENRA](#) on the importance of Nuclear Safety in the current Energy Crisis and supports WENRA's call for stability.

ENISS and its member organisations have always been proud to provide safe, secure, low carbon, large scale electricity generation. The current energy crisis has highlighted the value this contribution makes to European society.

ENISS and its member organisations are committed to nuclear safety and all our operations treat this as a priority.

ENISS believes nuclear power can be an important part of the solution to the Energy Crisis and climate emergency for those nations who choose to have nuclear as part of their energy mix.

ENISS and its members will continue to prioritise nuclear safety across the industry as solutions are developed and, whether through development of new facilities or life extensions for existing plants, that commitment will be unchanged.

ENISS and its member organisations also recognise the important role that independent nuclear regulators play in providing a stable regulatory framework enabling the operators to deliver safe, secure, low carbon electricity generation.
